ISMAIL ZABIULLAH

Roll Number

3BR24AI418T

## EXPERIMENT

Title

SUM OF NUMBERS AT PRIME FACTORS

Description

Prime factors of a positive integer are the prime numbers that divide that integer exactly.

Given an array arr of n integers and a positive integer num.

Let's suppose prime factorization of num is:  $p^a \times q^b \times r^c \times \dots \times z^f$ , where p,q,r...z are prime numbers.

Sum of numbers in array arr at indices of prime factors of number num is:  $a \times arr[p] + b \times arr[q] + c \times arr[r] + \dots + f \times arr[z]$ .

You are given an array arr of size n and a positive integer num. You are required to calculate the sum of numbers in arr as mentioned above, and print the same.

Note:

- If arr is empty, print -1.
- If prime factor of num not found as indices, print 0.

### Input Format:

The input consists of three lines:

- The first line contains an integer, i.e. n.
- The second line contains an array arr of length of n.
- The third line contains an integer num

The input will be read from the STDIN by the candidates.

Output Format:

Print the sum that was mentioned in the problem statement.

Example:

Input:

6

11 21 32 45 1 23

6

Output:

77

Explanation:

$6=2^1 \times 3^1$

$sum=1*arr[2]+1*arr[3]=1*32+1*45=77$

Source Code:

```
n = int(input())
arr = list(map(int,input().split()))
num = int(input())
sum = 0
if n == 0:
    print(-1)
else:
    i = 2
    while i *i<= num:
        count = 0
        while num % i == 0:
            count += 1
            num //= i
        if i < n:
            sum += count * arr[i]
        i += 1
    if num > 1 and num < n:
        sum += arr[num]
    print(sum if sum > 0 else 0)
```
