# **EXPERIMENT**

# % Title

ANT ON RAIL

## **Description**

There is a ant on your balcony. It wants to leave the rail so sometimes it moves right and sometimes it moves left until it gets exhausted. Given an integer array A of size N which consists of integer 1 and -1 only representing ant's moves.

Where 1 means ant moved unit distance towards the right side and -1 means it moved unit distance towards the left . Your task is to find and return the integer value representing how many times the ant reaches back to original starting position.

### Note:

- Assume 1-based indexing
- Assume that the railing extends infinitely on the either sides

## **Input Format:**

**input1**: An integer value N representing the number of moves made by the ant.

**input2**: An integer array A consisting of the ant's moves towards either side

# Sample Input

5

1 -1 1 -1 1

# **Sample Output**

# **Source Code:**

```
N=int(input())
A=list(map(int,input().split()))
count=0
position=0
for i in range(N):
    position+=A[i]
    if position==0:
        count+=1
print(count)
```
